                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid encoding a PRO polypeptide. The polypeptide, agonist or an antagonist, antibody, composition, and method are useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatcid arthritis. The present sequence represents a DNA encoding a PRO
                                                                                                                                                 New nucleic acid encoding PRO polypeptide, useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, thyroiditis, or diabetes mellitus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The specification describes polynucleotides which are associated with melanoma and thyroid tumors. Specifically, these are MEL3, MEL7, Thy5, Thy1, Thy14, and Thy15. The polynucleotides are useful for diagnosing and treating a patient with melanoma, thyroid tumour, rectal cancer, lung cancer, breast cancer or colon cancer. The present sequence represents a polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antiinflammatory; Immune disorder; Dermatological; Immunosuppressive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antirheumatic; Antiarthritic; Osteopathic; Hemostatic; Antianemic; Antithyroid; Antidiabetic; Nephrotropic; CNS-Gen.; Hepatotropic; Virucide; Gastrointestinal-Gen.; Antipsoriatic; Antiasthmatic;

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic sact sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

This invention describes a novel oligoribo- or oligodeoxyribonucleotide, characterized in that, it hybridizes to mRNA that encodes protein Ki-67

The invention relates to a combination comprising a number of cDNAs expressed in prostate cancer. The invention also relates to a method for detecting differential expression of one or more cDNAs in a sample containing nucleic acids by hybridising a substrate with the nucleic acids, thus forming one or more hybridisation complexes, detecting hybridisation complexes, where differences between the standard and the sample complex formation and comparing the complexes formed with standard formation indicate differences between the standard and the sample complex formation also related differential expression of cDNAs in the sample. The differential expression is diagnostic of prostate cancer. The invention also relates to proteins and antibodies related to the CDNAs. at a physiologically acceptable salt concentration. The oligoribo- or oligodeoxyribonuclectide which is complementary to K1-67, a protein active at all stages of the cell cycle except 6 0, is useful for therapy of illnesses with increased cell proliferation and particularly for tractment of tumors, autofmmune diseases, scar formation, inflammation, allergy, rheumatic diseases and defence against transplantation. This sequence encodes the human cell cycle protein Ki-67 which is described in Human; prostate cancer; ss; cDNA combination; differential expression; progression of treatment of prostate cancer. The antibodies are useful New combination comprising cDNAs that are differentially expressed in prostate cancer, useful for diagnosing, treating or monitoring the progression of treatment of prostate cancer.                                                                                                                                                  The specification describes polynucleotides which are associated with melanoma and thyroid tumors. Specifically, these are MEL3, MEL7, Thy5, Thy1, Thy14, and Thy15. The polynucleotides are useful for diagnosing and treating a patient with melanoma, thyroid tumour, rectal cancer, lung cancer, breast cancer or colon cancer. The present sequence represents a polynucleotide of the invention
  for detecting prostate cancer. This sequence represents a human prostate cancer cDNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the dara collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, and cancer, infiltrating lobular cancer, squamous call carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                               Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ss; gene; human; adipocyte differentiation; obesity; type II diabetes; lipodystrophy; hyperinsulinaemia.

```
The invention relates to an isolated cDNA expressed during adipocyte differentiation. The cDNA is useful for treating a subject with a disorder such as obesity, type II diabetes, lipodystrophy or hyperinsulinaemia. The nucleic acid is useful for a high throughput method of using a cDNA to screen several molecules or compounds to identify a ligand which specifically binds the cDNA which involves combining the nucleic acid with several molecules or compounds under conditions to allow specific binding, and detecting specific binding between each cDNA and at least one molecule or compound, thus identifying a ligand that specifically binds to each cDNA. The several molecules or compounds are chosen from DNA molecules, RNA molecules, peptide nucleic acid molecules, mimetics, peptides, transcription factors, repressors and regulatory proteins. The present sequence represents a human cDNA expressed during adipocyte differentiation.
                                                                                                                                                                                             Novel isolated cDNAs expressed in adipocyte differentiation useful for treating subject with disorder such as obesity, type II diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 12515 BP; 4166 A; 3048 C; 2928 G; 2373 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                    The invention relates to a method of predicting clinical outcome for a patient diagnosed with cancer by determining the expression level of one or more genes, or their expression products, selected from p53BP2.

cathepsin B, cathepsin L, Ki67/MiBI, and thymidine kinase in a cancer tissue obtained from the patient, normalized against control gene(8), and compared to the amount found in a reference cancer tissue set. The specification also discloses an array comprising polymucleotides hybridizing to the following genes: FOXMI, PRAME, BGL2, STKIS, CEGPI, Ki-ST, GSTH3, PRP, BRG3, NNEI, SURV, GAM13, TFRC, XB-1, DPVD, GSTM3, RPS6KB1, Sro, Chki, IDI, BetRI, p27, CCNBI, XIAP, Chk2, CDC2SB, IGFR, RNESAS, BRCA2, BRCA2, BCRA2, BCRA, BCRA, BCRA, GER, TKI, VDR, CONTISSION, PRINTI, EPHXI, HNF3A, NFKB965, BRCA2, EGFR, TKI, VDR, CONTISSION, PRINTI, EPHXI, IFIA, CDHI, HIFL, IGFRB3, GTSB, Harz and DIABLO, immobilized on a solid surface. The methods are useful for predicting clinical outcome for a
                                   Predicting clinical outcome for a patient diagnosed with cancer comprises determining the expression level of one or more genes, and compared to the amount found in a reference cancer tissue set.
                                                                                                                                                                                                                                                                                                                                                                                                                                            patient diagnosed with cancer, classifying cancer, and predicting the likelihood of long-term survival of a breast cancer patient, or a patient diagnosed with invasive breast cancer or with estrogen receptor (ER)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          growth, differentiation, blood endothelial cell; BEC; lymphatic endothelial cell; LEC; hereditary lymphoedema; VEGFR-3; lymphatic growth agent; VEGFC-7; VEGF-0; antianglogenic; cytostatic; vasotropic; antiinflammatory; gene therapy; endothelial cell disorder; inflammatory disease; cancer metastasis; lymphatic system; gene; ds;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      positive invasive breast cancer. This sequence corresponds to a gene sequence whose expression is detected by the method of the invention.

This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) comprises contacting endothelial cells with a composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation correlates with lymphoedema in human subjects, and with the provise that the LEC protein is not VEGFR-3; and administering to the subject a composition comprising a lymphatic growth agent selected from VEGF-C or VEGF-D polypeptides and polynucleotides. The invention may be useful for the development of composition composition comprising a lymphatic growth agent selected from VEGF-C or VEGF-D polypeptides and polynucleotides. The invention may be useful for the development of composition to reactive activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells, in treating hereditary lymphoedema, in screening for an endothelial cells, in treating hereditary of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the discorder or in monitoring the efficacy or toxicity of a drug on endothelial cells are endothelial cell growth or differentiation. The lymphatic growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutation in a LEC gene or of other diseases involving the lymphatic vessels, such as various inflammatory diseases and cancer metastasis via the lymphatical cells that of a human LEC/BEC differentially expressed gene which is related to the method of the invention. Note: This sequence does not appear in the specification but was obtained by the company of the source data given in table if of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 12515 BP; 4166 A; 3048 C; 2928 G; 2373 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel isolated nucleic acid associated with bronchial cancer comprising 489 defined sequences given in the appoint of the invention may be useful for the production of compounds with a cytostatic activity through the inhibition of expression or activity of tumour-associated proteins. The novel DNA sequences and the proteins/peptides encoded by them are used for detecting bronchial cancer or determining the risk of developing it and to screen for specific binding partners of the DNA or protein sequences, where the binding partners are potentially useful as agents for treating or classociate for prognosis, detection of metastases and for secondary treatment of the used for prognosis, detection of metastases and for secondary treatment of the unours that have been stabilised or are no longer detectable). Detecting abnormal expression of the DNA sequences provides early diagnosis of bronchial cancers. The present sequence is that of a novel bronchial cancer-associated human gene sequence of the invention.
                                                                                                                                           New nucleic acid, and derived proteins, useful for diagnosis of bronchial cancer and in screening for therapeutic and diagnostic agents.

the there a mammal will respond or in responding to an anti-cancer agent that modulates cyclin-dependent kinase (dk) activity. The method comprises measuring the level of one or more blomarkers selected from 2774 biomarkers given in the specification (nucleotide sequence SEQ ID NO:1246 (Genbank EST W28729) is especially preferred). The method of the invention is utilized in a kit for determining or predicting whether patient would be susceptible or resistant to treatment by an agent modulating cdk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed microarrays comprising the biomarkers described, antibodies directed microarrays comprising the biomarkers and a cell culture model to identify biomarkers. The cdk modulator is preferably N-5-[[5-(1,1-b]methylethyl]-2-caracid salt. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fp. wipo.inft was obtained in electronic format directly from WIPO at fp. wipo.inft the method of the invention.

The invention relates to a method of analyzing differential gene expression associated with breast tumor. The method comprises detecting the over expression or under expression of sequences neighboring the BRB2 (also known as HER2 or Neu) on chromosome 17q12. The polynucleotide expression profiling comprises at least one, preferably at least two, three or all polynucleotide sequences (or its subsequence or complement) selected from predefined polynucleotide sequence sets consisting of: Set 1: SEQ ID NOS: 13.77 (ERBB2), Set 2: SEQ ID NOS: 28-30 (GRB7), Set 3: SEQ ID NOS: 83-85 (MR1D1), Set 4: SEQ ID NOS: 78-80 (GRB74), Set 5: SEQ ID NOS: 41-43 (CDH15), Set 6: SEQ ID NOS: 16, 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene expression; breast tumor; BRBB2; HBR2; Neu; oncogene; chromosome 17; DNA library; DNA microarray; diagnosis; cytostatic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analyzing differential gene expression, useful for detecting, diagnosing, staging, monitoring, predicting, preventing or treating breast cancer, comprises detecting an ERBB2 gene expression signature.
The invention relates to an isolated nucleic acid encoding a PRO polypeptide. The polypeptide, agonist or an antagonist, antibody, composition, and method are useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis. The present sequence represents a DNA encoding a PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Breast cancer associated human polynucleotide sequence, SEQ ID No:58.

The method of the invention is useful for the identification of an BRBB2 gene expression signature in breast cancer. The methods and sequences are useful for detecting, diagnosing, staging, monitoring, predicting, preventing or treating conditions associated with breast cancer, and are used to follow up the stage or aggressiveness of a breast cancer. This sequence represents a human polynucleotide sequence located on chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                17q12 that can be used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for characterizing the state of a meoplastic disease in a subject comprising determining the pattern of expression levels of at least 6, 810,15, 20, 30, 47 or 67 marker genes in a biological sample, comparing the pattern of expression levels with reference patterns of expression levels and characterizing the state of the neoplastic disease in the subject from the outcome of the comparison. The method of the invention demonstrates cytostatic applications and may be useful in characterizing the state of a neoplastic disease in a subject, preferably breast cancer, in gene therapy and for screening for compounds having a curative effect on a neoplastic disease. The current sequence is that of the human breast cancer marker MKIG7 DNA of the invention which is differentially expressed in neoplastic tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Characterizing the state of a neoplastic disease in a subject by comparing the pattern of determined expression levels of marker g a biological sample with reference patterns of expression levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 12515 BP; 4166 A; 3048 C; 2928 G; 2373 T; 0 U; 0 Other;

```
The invention relates to a combination comprising a plurality of cDNAs, or their complements that are differentially expressed in cancer and cherry proliferative disorders. The combination is useful in detecting changes in expression of genes encoding proteins that are associated with senescence and in diagnosing, staging, treating, or monitoring the progression or treatment of subjects with proliferative diseases such as cancer e.g. adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, bone marrow, brain, breast, cervix, colon, oesophagus, gall bladder, bone, ganglia, heart, kidney, liver, lung, muscle, ovary, pancreas, parathyroid gland, penis, prostate, salivary glands, skin, small intestine, spleen, stomach, testis, thymus, thyroid and uterus. The present sequence represents cDNA of genes that are downregulated in senescent cells

8×4×6×8

BP

the interaction retailers to manning and the properties are oblypoptides, and their related nucleic acids. The TAT polypoptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypoptide polypoptide at least 80% identical to the TAT nucleic acids and polypoptide and polypoptide and polypoptide and antibody specific for a TAT polypoptide; a peptide or organic molecule which binds to a TAT polypoptide; fusion proteins comprising a TAT polypoptide, fusion proteins comprising a TAT polypoptide, fusion proteins comprising a TAT polypoptide, and methods and compositions for the treatment or aliagnosis of cancer in mammals. TAT polypoptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancer, liver cancer, bladder cancer, lung cancer, cervical cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence invention relates to human tumour-associated antigenic target Sequence 12674 BP; 4164 A; 3103 C; 3017 G; 2390 T; 0 U; 0 Other; 00000 Matches: Conservative: Mismatches: chromosome identification and in gene therapy. represents a TAT nucleic acid of the invention Length: Indels: US-09-989-890-238 (1-212) x ACN39127 (1-12674) Claim 1; SEQ ID NO 3074; 7273pp; English. The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            prox-1; developmental disorder, Usher Syndrome Type II;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method (MI) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the subtype of leukemia cells and whether a patient sample contains leukemia cells or other cells, useful for treating leukemia, comparises determining the expression profile of a group of markers in a patient sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Kohlmann A, Schnittger S, Dugas M;

                                                                                                                                                                                                                                                                                                                 $86666666666688$$
                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                       셤
                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding prox-1 and inhibits the expression of prox-1. The compound, composition and methods are useful for treating a disease or condition associated with prox-1, such as a developmental disorder e.g. Usher Syndrome Type II, or an ocular disorder, e.g. retinal degradation or retinitis pigmentosa. They are also useful in research and diagnostics for modulating the expression of prox-1. The present sequence represents a human PROX-1 DNA.
                                                                 New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding prox-1 useful for treating a disease or condition associated with prox-1, e.g. cancer, Alzheimer's disease or neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening, diagnosis and therapy of colon tissue for a pathological condition, e.g. colorectal cancer, where elevation of transcription factor Prox-1 expression correlates with a pathological phenotype.
                                                                                                                                                                                                                                 Sequence 48396 BP; 13584 A; 9992 C; 9850 G; 14970 T; 0 U; 0 Other;

The invention relates to a method of screening colon tissue for a pathological condition which comprises measuring Prox-1 expression in a biological sample that comprises colon tissue from a mammalian subject, where elevated Prox-1 expression in the colon tissue correlates with a pathological phenotype. The molecule that suppressed expression or activity of Prox-1 is useful in the manufacture of a medicament for the treatment of colorectal cancer. The inhibitor of Prox-1 function in mammalian cells is useful for the manufacture for inhibiting Prox-1 function. The siRNA molecule is useful in the manufacture of a medicament for the treatment of colorectal cancer. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; gene; de; transporter protein; allelic variant; SNP;

The invention discloses an isolated human transporter polypeptide, and its allelic variants or orthologues, and the polymucleotides encoding them allelic variants or orthologues, and the polymucleotides encoding concluding cell proliferation, differentiation and signalling processes, including cell proliferation, differentiation and signalling processes, by regulating the flow of molecules, such as ions and macromolecules, into and out of cells. The polymucleotide and polypeptide can be used to raise antibodies, create a gene chip, create a transgenic non-human animal, produce the novel polypeptide, detect the presence of the polypeptide or nucleic acid in a sample, identify a modulator of the polypeptide or nucleic acid in a sample, identify a modulator of the composition, and carrier, that binds to the polypeptide and treat a disease or condition mediated by a human transporter protein which composition, and carrier, that binds to the polypeptide and nucleic acid a patient the composition identified. The peptides and nucleic acid approach or composition in the development of human therapeutics and diagnostic compositions. The peptides are also useful for eliciting an immune response, to quantitatively determine levels of the protein (or its binding partner or ligand) in biological fluids or as markers for the agents identified are useful for treating transporter-related conditions and a modulator of the peptide is also useful for treating a disorder characterised by an absence of, inappropriate or unwanted expression of the protein gene presented is the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated human transporter proteins, useful for developing therapeutic or diagnostic compositions, particularly for developing human therapeutic agents that modulate transporter activity in cells or

The invention relates to recombinant (ADAD1482-ADAD3094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a CA muclaic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a biochip comprising CA muclaic acid or fragments thereof. The sequences of the invention were identified using concepenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or a random. Many of these do not carry transduced host oncogenes or direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, includence of acronoma (especially breast cancer, prostate cancer, includence of acronoma or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA mucleic acids, proteins and antibodies are also useful as therespeutic agents and in screening and evaluating drug candidates. The present sequence of the printed page of the printed specification, but was obtained in electronic format directly from WIPPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention relates to recombinant carcinoma associated (CA) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 96600 BP; 27391 A; 19001 C; 20558 G; 29350 T; 0 U; 300 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinomassociated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant nucleic acid comprising a nucleotide sequence of any of the carcinoma-associated (CA) genes, useful for screening for drug candidates for diagnosing or treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 96599 BP; 27390 A; 19000 C; 20559 G; 29350 T; 0 U; 300 Other;

                                                                                                                                                                                                                                                                                The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a mouse gene of the invention.
                                                                                                                                                                                                                           New recombinant nucleic acid, useful for treating carcinomas, lymphomas,

The invention relates to new recombinant nucleic acids. The invention clates to a host cell comprising a recombinant nucleic acid or also relates to a host cell comprising a recombinant nucleic acid. The expression vector comprising a recombinant nucleic acid, a recombinant protein, a method of screening for a bicactive agent capable of binding to a method of screening for a bicactive agent capable of binding to a cartivity of a CAP, a method of evaluating the effect of a candidate a cartivity of a CAP, a method of evaluating the effect of a candidate cartinoma drug, a method of diagnosing carcinoma, a method for inhibiting the activity of a CAP, a method of the activity of a CAP, a method of diagnosing carcinoma, a method of the activity of a CAP, a method of diagnosing carcinoma or propensity to carcinoma Amethod of the activity of a CAP, a method of diagnosing carcinoma or propensity to carcinoma acupacises administering the drug to a patient, removing a carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the mucleotide sequence. A method of diagnosing carcinoma comprises determining alterations in the expression or activation of a gene comprising the expression of the gene from the patient and comparing the expression of the gene from the patient and comparing the expression of the gene from the first individual and comparing the expression of the gene from the first individual has carcinoma. A method of inhibiting the carcinomas comprises binding an inhibitor to the CAP. The polyaptide specifically binds to the protein encoded by the nucleic acid. It comprises an antibody that specifically binds to the protein encoded by the nucleic acid are useful for the nucleic acid. The nucleic acid are useful for preparing a composition for diagnosing or treating carcinoma accinome acid of this patent did not form part of the privation specifically privatically prepared as any contactined specification and captined individual and compared specifically because
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 96600 BP; 27391 A; 19001 C; 20558 G; 29350 T; 0 U; 300 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (17-AUG-2004) MIPS, Ingolstaedter Landstr.1, D-85764
Neuherberg, GERMANY
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKFZ); Bamil s.wiemannagkfz-heidelberg.de;
sequenced by DKFZ (German Cancer Research Center,
Heidelberg/Germany) within the cDNA sequencing consortium of the
German Genome Project. This clone (DKFZp686B17277) is available at
the RZPD Deutsches Ressourcenzentrum fuer Genomforschung GmbH in
Berlin, Germany. Please contact RZPD for ordering:
http://www.rzpd.de/cggi-bin/products/cl.cgi?CloneID=DKFZp686B17277
Further information about the clone and the sequencing project is
available at http://mips.ggf.de/projects/cdna/.

/note="Organ: Stomach; Vector: pME18-FL3; Site_l: XhoI;
Site_2: XhoI; The poly (A)+ RNA was dephosphorylated with batceraia lalkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including Sfis site by treatment of TA RNA ligase and the first strand cDNA was synthesized with Superscript II using Sfis oligo-dT primer. After first strand synthesis, RNA was degraded by NaOH treatment and cDNA was amplified by PCR reaction. The PCR products were digested with Sfil and cloned into Drail! - digested pME185-FL3 vector. The obtained cDNA vectors were used for transformation of competent cells E. coll Toplof* by electroporation method. The CDNA libraries constructed by this method are full-length enriched CDNA library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CR763815 21-58F2-2004

Funding for cattle EST sequencing was provided by the USDA National
Research Initiative, Animal Genome Resource Grant AG 99-3205-8534
to H. A. Lewin and J. E. Womack, Base Calling/Quality Scores: PHRED
from Washington University Genome Center. Vector Trimmi g:
Cross match from Washington University Genome Center PHRAP suite.
This sequence is vector free and at least 200 bp in length.

Plasmid DNA from the normalized library NoT CGAP Kid3 was
prepared, and ss circles were made in vitro. Following HAP
purification, this DNA was used as tracer in a subtractive
hybridization reaction. The driver was PCR-amplified cDNAs
from a pool of 5,000 clones made from the same library
(clonelDs 1322376-1323911, 1456007-1456775, and
1500552-1502855). Subtraction by Bento Soares and M.
Fatima Bonaldo.

Plasmid DNA from the normalized library NoT_CGAP_Kid3 was
prepared, and ss circles were made in vitro. Following HAP
purification, this DNA was used as tracer in a subtractive
hybridization reaction. The driver was PCR-amplified cDNAs
from a pool of 5,000 clones made from the same library
(cloneIDs 1322376-1323911, 1456007-1456775, and
1500522-15028855). Subtraction by Bentc Soares and M.
Fatima Bonaldo.
